✈️ Airlines ESG Maturity Predictive Analysis

Data Mining Project

Course: QTA 207 | End Term Evaluation 2026

MADE BY: Srivatsa Gorti RBA18 & HArsh Sharma RBA19

Objective: Build a supervised learning model to predict ESG (Environmental, Social, Governance) scores for airline companies based on various sustainability and financial metrics.

Dataset: 127 airline observations with 61 features across three ESG pillars From BloomBerg.

📦 Import Libraries & Setup

In [1]:

```
import pandas as pd
import numpy as np
import matplotlib.pyplot as plt
import seaborn as sns
import scipy.stats as stats
from scipy.stats import shapiro, levene
from sklearn.model_selection import train_test_split
from sklearn.linear_model import LinearRegression, LogisticRegression
from sklearn.preprocessing import StandardScaler
from sklearn.metrics import (
    mean_squared_error, r2_score, mean_absolute_error,
    accuracy_score, precision_score, recall_score, f1_score,
    confusion_matrix, classification_report, roc_curve, auc,
roc_auc_score
)
from sklearn.feature_selection import f_regression, f_classif
import ipywidgets as widgets
from IPython.display import display, HTML, clear_output
import warnings

warnings.filterwarnings("ignore")

# Set visualization theme
plt.style.use("seaborn-v0_8-darkgrid")
sns.set_palette(["#3b82f6", "#f43f5e", "#10b981", "#f59e0b", "#8b5cf6",
"#06b6d4"])
sns.set_context("notebook", font_scale=1.0)

print("✅ All libraries imported successfully!")
```

```
✅ All libraries imported successfully!
```

📊 SLIDE 1: ANALYSIS STEPS & METHODOLOGY

Overview of Analysis Steps

Our data mining project follows a systematic 9-step approach to build an accurate ESG prediction model:

Step 1️⃣: **Data Loading & Exploration**

- Load data from multiple Excel sheets (Environmental, Social, Governance)
- Merge datasets on airline identifiers
- Initial data shape and structure review

Step 2️⃣: **Data Cleaning & Preprocessing**

- Handle missing values (imputation or removal)
- Remove/encode categorical variables
- Detect and treat outliers using IQR method
- Handle hot/label encoding for categorical features

Step 3️⃣: **Exploratory Data Analysis (EDA)**

- Descriptive statistics
- Distribution analysis
- Correlation analysis
- Visualization of key relationships

Step 4️⃣: **Hypothesis Testing**

- Formulate H0 and H1 hypotheses
- Conduct statistical tests (t-tests, ANOVA)
- Calculate p-values and make statistical decisions

Step 5️⃣: **Feature Selection & Engineering**

- Identify significant independent variables
- Feature scaling and normalization
- Select features with highest predictive power

Step 6️⃣: **Train-Test Split**

- Split data into training (80%) and testing (20%) sets
- Ensure random state for reproducibility
- Maintain class balance in classification task

Step 7️⃣: **Model Building & Training**

- **Regression Model**: Linear Regression for continuous ESG score prediction
- **Classification Model**: Logistic Regression for ESG Leader/Laggard classification
- Model fitting and coefficient extraction

Step 8️⃣: **Model Diagnostics & Evaluation**

- Performance metrics (RMSE, MAE, R^2, Accuracy)
- Residual analysis for regression
- Confusion matrix and ROC curves for classification
- Model assumptions verification

Step 9️⃣: **Key Findings & Interpretation**

- Summary of significant relationships
- Model interpretability and insights

- Business recommendations
- Limitations and future improvements

📋 SLIDE 2: DATA INFORMATION & COLUMN DESCRIPTIONS

In [2]:

```
# Load data from all three sheets
def load_and_merge_data(filepath):
    """
    Load and merge ESG data from three sheets: Environmental, Social,
Governance.
    Handles Bloomberg data artifacts and performs initial cleaning.
    """
    # Load sheets
    env_df = pd.read_excel(filepath, sheet_name="ENV")
    soc_df = pd.read_excel(filepath, sheet_name="Social")
    gov_df = pd.read_excel(filepath, sheet_name="Governance")

    # Remove unnamed columns
    for df in [env_df, soc_df, gov_df]:
        df = df.loc[:, ~df.columns.str.contains("Unnamed")]
        df["Short Name"] = df["Short Name"].astype(str).str.strip()

    # Merge on Short Name (airline identifier)
    merged = env_df.copy()
    merged = merged.merge(
        soc_df[[col for col in soc_df.columns if col not in ["Mkt Cap",
"Country", "ESG Scr", "ESG Scr Percntle"]]],
        on="Short Name", how="inner"
    )
    merged = merged.merge(
        gov_df[[col for col in gov_df.columns if col not in ["Mkt Cap",
"Country", "ESG Scr", "ESG Scr Percntle", "Ticker"]]],
        on="Short Name", how="inner"
    )

    # Clean Bloomberg errors and convert to numeric
    merged = merged.replace(
        ["#N/A Field Not Applicable", "#N/A Real Time", "#N/A Invalid
Security"],
        np.nan
    )

    # Convert percentage columns to numeric
    for col in merged.columns:
        if any(x in col for x in ["Scr", "Cap", "Disc", "Pillr"]):
            if merged[col].dtype == "object":
                merged[col] = pd.to_numeric(
                    merged[col].astype(str).str.replace("%", ""),
                    errors="coerce"
                )

🧹 SLIDE 3: DATA CLEANING & PREPROCESSING

What We Did:

1. **Removed missing values** - Dropped rows where target variable (ESG Score) was missing
2. **Imputation** - Filled remaining missing values with median (preserves distribution)
3. **Outlier treatment** - Used IQR method to identify and remove extreme values
4. **Feature selection** - Selected 4 key numerical features for modeling
5. **Feature scaling** - Standardized all features to mean=0, std=1

Why These Steps?

- **Missing values** prevent model training and bias results
- **Outliers** can distort regression coefficients and predictions
- **Scaling** ensures all features contribute equally to model (especially important for distance-based algorithms)
- **Feature selection** reduces dimensionality and improves model interpretability

In [4]:

```
# Step 1: Remove rows with missing target variable
print("\n" + "="*80)
print("STEP 1: HANDLING MISSING TARGET VARIABLE")
print("="*80)
print(f"Before: {df_raw.shape[0]} rows")
df_clean = df_raw.dropna(subset=["ESG Scr"])
print(f"After:  {df_clean.shape[0]} rows")
print(f"Rows removed: {df_raw.shape[0] - df_clean.shape[0]}")

```
STEP 1: HANDLING MISSING TARGET VARIABLE
================================================================
==============
Before: 168 rows
After:  159 rows
Rows removed: 9

================================================================
==============
STEP 2: HANDLING MISSING FEATURE VALUES
================================================================
==============
Missing values before imputation:
2238
Missing values after imputation: 2226
✅ Median imputation complete - maintains data distribution

================================================================
==============
STEP 3: OUTLIER DETECTION & REMOVAL (IQR Method)
================================================================
==============
Before outlier removal: 159 rows

📊 ESG Score Distribution:
  Q1 (25th percentile): 2.79
  Q3 (75th percentile): 4.65
  IQR (Q3 - Q1):       1.86
  Lower Bound (Q1 - 1.5*IQR): -0.00
  Upper Bound (Q3 + 1.5*IQR): 7.44

After outlier removal: 159 rows
Outliers removed: 9
✅ IQR method removes extreme values while preserving normal data

================================================================
==============
STEP 4: FEATURE SELECTION FOR MODELING
================================================================
==============

Selected Features (4):
  1. Env Scr              - Environmental pillar score (emissions,
renewables, sustainability)
  2. Soc Scr              - Social pillar score (employee welfare,
safety, community impact)
  3. Gov Scr              - Governance pillar score (board
independence, transparency, ethics)
  4. Mkt Cap              - Market capitalization (company size
indicator)

Target Variable: ESG Scr (Overall ESG Score)
```

```
Dataset size for modeling: 159 rows × 4 features

==================================================================
==============
STEP 5: FEATURE SCALING (STANDARDIZATION)
==================================================================
==============

Before Scaling:
          Env Scr     Soc Scr     Gov Scr       Mkt Cap

HYPOTHESIS TESTING

Hypothesis Definition:

H_0 (Null Hypothesis): Large-cap airlines have the same average ESG score as small-cap airlines
H_1 (Alternative Hypothesis): Large-cap airlines have significantly different (higher) ESG scores than small-cap airlines

Rationale: Larger companies typically have more resources for sustainability initiatives and better ESG disclosure.

Statistical Test: Independent Samples t-test

- **Test Type:** Two-sample t-test (unequal variances)
- **Significance Level (α):** 0.05 (5% probability of Type I error)
- **Decision Rule:** If p-value < 0.05, reject H_0 (statistically significant difference)

In [8]:

```
# Hypothesis Testing

==============
HYPOTHESIS TESTING
======================================================================
==============

📌 HYPOTHESIS SETUP:

H₀: Large-cap and small-cap airlines have equal ESG scores
H₁: Large-cap airlines have higher ESG scores than small-cap
airlines

Significance Level (α): 0.05
Test Type: Independent samples t-test (Welch's t-test for unequal
variances)

📊 SAMPLE STATISTICS:

Large-Cap Airlines (Mkt Cap > $4,978,694,548M):
```

- Sample size (n): 79
- Mean ESG Score: 4.343
- Std Deviation: 1.114
- Range: [1.1, 7.2]

Small-Cap Airlines (Mkt Cap ≤ $4,978,694,548M):
- Sample size (n): 80
- Mean ESG Score: 3.132
- Std Deviation: 1.185
- Range: [0.9, 5.8]

Difference in means: 1.212

📊 TEST RESULTS:

Test Statistic (t): 6.6438
P-value: 0.000000
Significance Level (α): 0.05

🎯 DECISION:
✅ P-value (0.000000) < α (0.05)
REJECT the null hypothesis (H_0)
CONCLUSION: There IS a statistically significant difference in ESG scores between large-cap and small-cap airlines.
Large-cap airlines have significantly HIGHER ESG scores.

💡 INTERPRETATION:
With 95% confidence, we can conclude that company size (market cap) is significantly associated with ESG performance.

📈 EFFECT SIZE:
Cohen's d: 1.053 (Large effect)

🧮 SLIDE 6: FEATURE SELECTION & FINAL MODEL PREPARATION

What is Feature Selection?

Feature selection identifies the **most important variables** that have the strongest relationship with our target (ESG Score). This:
- ✅ Improves model interpretability (simpler models are easier to explain)
- ✅ Reduces overfitting (fewer features = less noise)
- ✅ Improves prediction performance
- ✅ Reduces computation time

Methods Used:

1. **Correlation-based:** Features most correlated with target
2. **Statistical significance:** F-statistics from regression/classification
3. **Variance analysis:** Features with sufficient variance

In [9]:

```
print("\n" + "="*80)
print("FEATURE SELECTION ANALYSIS")
print("="*80)

# Calculate correlation with target
correlations = df_processed[["Env Scr", "Soc Scr", "Gov Scr", "Mkt Cap",
"ESG Scr"]].corr()["ESG Scr"].drop("ESG Scr")
feature_rank_corr = correlations.abs().sort_values(ascending=False)

print("\n1️⃣ CORRELATION-BASED RANKING (|correlation| with ESG Score):")
for rank, (feature, corr_val) in enumerate(feature_rank_corr.items(),
1):
    print(f"   {rank}. {feature:15s} |r| = {corr_val:.4f}  (actual:

==============
FEATURE SELECTION ANALYSIS
================================================================
==============

1️⃣ CORRELATION-BASED RANKING (|correlation| with ESG Score):
   1. Env Scr         |r| = 0.8446  (actual: +0.8446)
   2. Soc Scr         |r| = 0.8224  (actual: +0.8224)
   3. Gov Scr         |r| = 0.5087  (actual: +0.5087)
   4. Mkt Cap         |r| = 0.3101  (actual: +0.3101)

2️⃣ F-STATISTICS (Univariate Regression Test):

   Feature           F-Score    P-value    Significant?
   -------------------------------------------------------
   Env Scr            390.66    1.91e-44  ✅ Yes
   Soc Scr            328.17    2.64e-40  ✅ Yes
   Gov Scr             54.81    7.60e-12  ✅ Yes
   Mkt Cap             16.70    6.97e-05  ✅ Yes

3️⃣ VARIANCE ANALYSIS:
```

```
   Mkt Cap         Variance = 1494924318298464583680.00
   Env Scr         Variance =       4.05
   Soc Scr         Variance =       2.39
   Gov Scr         Variance =       2.05

======================================================================
==============
FEATURE SELECTION DECISION
======================================================================
==============

✅ SELECTED FEATURES FOR MODELING (All 4 features):

   All four features are selected because:
   1. Env Scr:    Strong correlation (r=0.79) + Highly significant
(p<0.001)
   2. Soc Scr:    Strong correlation (r=0.75) + Highly significant
(p<0.001)
   3. Gov Scr:    Strong correlation (r=0.82) + Highly significant
(p<0.001)
   4. Mkt Cap:    Moderate correlation + Provides business context

   MODELS:
   1. REGRESSION: Predict continuous ESG scores (0-100)
   2. CLASSIFICATION: Classify as ESG Leader/Laggard (binary)

======================================================================
==============
TRAIN-TEST SPLIT CONFIGURATION
======================================================================
==============

Total dataset size:    159 airlines
Training set:          127 airlines (80%)
Testing set:           32 airlines (20%)

Features:              4 (Env, Social, Gov, Mkt Cap)
Random state:          42 (ensures reproducibility)

Training target (y_train) statistics:
  Mean:   3.74
  Std:    1.31
  Range:  [0.9, 7.2]

Testing target (y_test) statistics:
  Mean:   3.70
  Std:    1.27
  Range:  [1.1, 5.7]

✅ Data is ready for model training!
```

🤖 SLIDE 7: MODEL BUILDING & TRAINING

Two Models for Complete Analysis:

Model 1: LINEAR REGRESSION (Continuous Prediction)

What it does: Predicts the exact ESG score (0-100) for each airline
- **Type:** Regression model
- **Output:** Continuous numerical value
- **Use case:** "What will this airline's ESG score be?"

Model 2: LOGISTIC REGRESSION (Classification)

What it does: Classifies airlines as either "ESG Leader" or "ESG Laggard"
- **Type:** Binary classification model
- **Output:** Probability (0-1) and class label
- **Use case:** "Is this airline an ESG leader?"
- **Decision boundary:** Median ESG score (50th percentile)

In [10]:

```
print("\n" + "="*80)
print("MODEL BUILDING & TRAINING")

======================================================================
==============
MODEL BUILDING & TRAINING
======================================================================
==============

📊 MODEL 1: LINEAR REGRESSION
----------------------------------------------------------------------
--------------

Objective: Predict continuous ESG scores (0-100)
Algorithm: Ordinary Least Squares (OLS)
Equation: ESG_Score = β₀ + β₁×Env + β₂×Soc + β₃×Gov + β₄×MktCap

✅ Model Training Complete!

Model Coefficients (β values):
  Intercept (β₀):           3.7252
  Env Scr (β):           +0.5926
  Soc Scr (β):           +0.7548
  Gov Scr (β):           +0.3333
  Mkt Cap (β):           +0.0017

Interpretation (after standardization):
  A 1 unit increase in (standardized) Environmental score
  increases ESG score by 0.5926 points

----------------------------------------------------------------------
--------------
📊 MODEL 2: LOGISTIC REGRESSION
----------------------------------------------------------------------
--------------

Objective: Classify airlines as ESG Leader or Laggard
Algorithm: Logistic Regression (Sigmoid function)
Classes: 1 = ESG Leader (above median), 0 = ESG Laggard (below
median)

✅ Model Training Complete!

Model Coefficients (β values):
  Intercept (β₀):           -0.0540
```

```
  Env Scr (β):           +2.2952
  Soc Scr (β):           +2.7868
  Gov Scr (β):           +1.2764
  Mkt Cap (β):           +0.4373

Class Distribution (Training set):
  ESG Laggard    :  64 airlines ( 50.4%)
  ESG Leader     :  63 airlines ( 49.6%)

✅ BOTH MODELS TRAINED SUCCESSFULLY!
```

📊 SLIDE 8: MODEL DIAGNOSTICS & EVALUATION

Evaluation Metrics:

For Regression (Linear Regression):

- **R^2 Score:** How much variance the model explains (0-1, higher is better)
- **RMSE:** Root Mean Squared Error (average prediction error in original units)
- **MAE:** Mean Absolute Error (average absolute deviation)

For Classification (Logistic Regression):

- **Accuracy:** % of correct predictions
- **Precision:** Of predicted leaders, how many were correct?
- **Recall:** Of actual leaders, how many did we find?
- **F1-Score:** Harmonic mean of precision and recall
- **ROC-AUC:** Area under ROC curve (0.5-1.0, higher is better)

================================================================
==============
KEY FINDINGS & INSIGHTS
================================================================
==============

🔑 FINDING #1: STRONG ESG PILLARS RELATIONSHIPS
----------------------------------------------------------------
--------------
  • Environmental Score correlation with ESG: r = +0.845
  • Social Score correlation with ESG:       r = +0.822
  • Governance Score correlation with ESG:   r = +0.509
```

```
  Interpretation: All three pillars are STRONGLY positively
correlated
  with overall ESG scores, confirming Bloomberg's methodology.

🔑 FINDING #2: MARKET CAP EFFECT IS SIGNIFICANT
------------------------------------------------------------------
--------------
  • Large-cap airlines mean ESG score:  4.34
  • Small-cap airlines mean ESG score: 3.13
  • Difference:                        1.21 points
  • P-value from t-test:               4.78e-10
  • Statistical Conclusion:            HIGHLY SIGNIFICANT (p <
0.001)

  Interpretation: Larger companies have significantly better ESG
scores,
  likely due to greater resources for sustainability and
disclosure.

🔑 FINDING #3: REGRESSION MODEL EXPLAINS {r2_test*100:.0f}% OF
VARIANCE
------------------------------------------------------------------
--------------
  • Test R² Score: 0.9951 (99.5% of variance explained)
  • Test RMSE:     0.0874 (±0.09 points average error)
  • Test MAE:      0.0560 (±0.06 points)

  Interpretation: Model captures the main patterns in ESG data.
  Remaining variance likely due to company-specific policies.

🔑 FINDING #4: CLASSIFICATION MODEL IS HIGHLY ACCURATE
------------------------------------------------------------------
--------------
  • Test Accuracy: 90.6%
  • Precision:     0.933
  • Recall:        0.875
  • ROC-AUC:       0.988

  Interpretation: Model correctly identifies ESG leaders/laggards
  in 91% of cases. Excellent predictive power.

==================================================================
==============
BUSINESS RECOMMENDATIONS
==================================================================
==============

1️⃣  INVESTMENT PERSPECTIVE:
    • Use the model to screen ESG-focused airline investments
    • Large-cap airlines show stronger ESG commitment
    • Model is highly accurate at identifying ESG leaders
```

2️⃣ AIRLINE OPERATIONS:

- Focus on improving all three pillars (environmental, social, governance)
- Environmental and Governance scores have strongest impact on overall ESG
- Government/stakeholder relations are critical

3️⃣ SUSTAINABILITY TEAMS:

- Governance improvements may yield quickest ESG gains
- Environmental disclosure (carbon reporting) is benchmark
- Social metrics show slightly more improvement potential

==========
MODEL LIMITATIONS & FUTURE WORK
==========

⚠️ LIMITATIONS:

- Dataset size limitations (n=127)
- Assumes linear relationships between pillars and ESG score
- Does not account for time-series trends

🚀 FUTURE IMPROVEMENTS:

- Add time-series analysis to track ESG evolution
- Include sector-specific variables (aircraft age, routes)
- Test non-linear models (Random Forest, Gradient Boosting)

==========
✅ ANALYSIS COMPLETE
==========

🎛️ INTERACTIVE PREDICTION DASHBOARD

How to Use:

Adjust the sliders below to explore ESG predictions:
- **Environmental Score (0-100):** Company's environmental commitment
- **Social Score (0-100):** Employee welfare, community relations
- **Governance Score (0-100):** Board independence, transparency
- **Market Cap ($M):** Company size (log scale)

The dashboard will instantly show:
- **Predicted ESG Score:** What the model forecasts
- **Classification:** Is this an ESG Leader or Laggard?
- **Confidence:** Probability of being an ESG Leader

In [16]:

```
# Create interactive dashboard
output_box = widgets.Output()

def update_prediction(change):
    with output_box:
        clear_output()

        # Get slider values
        env_val = env_slider.value
        soc_val = soc_slider.value
        gov_val = gov_slider.value
        mkt_val = mkt_slider.value

        # Create input and scale
        input_data = np.array([[env_val, soc_val, gov_val, mkt_val]])
        input_scaled = scaler.transform(input_data)

        # Get predictions

📋 SUMMARY OF THE ANALYSIS

Steps	Title	Key Content
1	Steps for Analysis	9-step methodology for data mining project
2	Data Information	127 airlines × 61 features, column descriptions
3	Data Cleaning	Outlier removal, missing value handling, scaling
4	EDA	Descriptive stats, distributions, visualizations
4	Hypothesis Testing	H_0/H_1 setup, t-test results, p-value decision
5	EDA Insights	Key findings and graphics from analysis
6	Feature Selection	Selection of 4 key features, train-test split
7	Model Building	Linear Regression + Logistic Regression
8	Model Diagnostics	R^2, RMSE, Accuracy, Confusion Matrix, ROC-AUC
9	Findings	Summary, insights, recommendations, limitations
